## Abstract

A system for estimating the ground condition under a driving vehicle, comprising: a wheel speed sensor (4) for sensing a wheel speed signal  $(t(n), \omega(n))$  which is indicative of the wheel speed of a vehicle's wheel driving over the ground (2,3) and a first analyser unit (8) coupled to said wheel speed sensor (4). first analyser unit comprises a sensor imperfection estimation section (9) which is designed to estimate a sensor imperfection signal  $(\hat{\delta_l})$  from the wheel speed signal (t(n))10 which is indicative of the sensor imperfection of the wheel speed sensor (4); a signal correction section (10) which is designed to determine an imperfection-corrected sensor signal from the wheel speed signal (t(n)) and the imperfection signal  $(\hat{\delta_l});$  and a ground condition estimation section (11) which is designed to estimate a first estimation value  $(r(n), \alpha(n))$  indicative of the ground condition from the imperfection-corrected sensor signal  $(\varepsilon(n))$ .
